

Fun with Functions, by Example

Joe Conway
joe.conway@credativ.com

credativ International

February 20, 2015

What are Functions?

- Full fledged SQL objects
- Many other database objects are implemented with them
- Fundamental part of PostgreSQL's system architecture
- Created with CREATE FUNCTION
- Executed through normal SQL
 - target-list:
`SELECT myfunc(f1) FROM foo;`
 - FROM clause:
`SELECT * FROM myfunc();`
 - WHERE clause:
`SELECT * FROM foo WHERE myfunc(f1) = 42;`

How are they Used?

- Functions
- Operators
- Data types
- Index methods
- Casts
- Triggers
- Aggregates
- Ordered-set Aggregates
- Window Functions

What Forms Can They Take?

- PostgreSQL provides four kinds of functions:
 - SQL
 - Procedural Languages
 - Internal
 - C-language
- Arguments
 - Base, composite, or combinations
 - Scalar or array
 - Pseudo or polymorphic
 - VARIADIC
 - IN/OUT/INOUT
- Return
 - Singleton or set (SETOF)
 - Base or composite type
 - Pseudo or polymorphic

SQL Functions

- Behavior
 - Executes an arbitrary list of SQL statements separated by semicolons
 - Last statement may be INSERT, UPDATE, or DELETE with RETURNING clause
- Arguments
 - Referenced by function body using name or \$n: \$1 is first arg, etc...
 - If composite type, then dot notation \$1.name used to access
 - Only used as data values, not as identifiers
- Return
 - If singleton, first row of last query result returned, NULL on no result
 - If SETOF, all rows of last query result returned, empty set on no result

Procedural Languages

- User-defined functions
- Written in languages besides SQL and C
 - Task is passed to a special handler that knows the details of the language
 - Dynamically loaded
 - Could be self-contained (e.g. PL/pgSQL)
 - Might be externally linked (e.g. PL/Perl)

<http://www.postgresql.org/docs/9.4/static/xplang.html>

Internal Functions

- Statically linked C functions
 - Could use CREATE FUNCTION to create additional alias names for an internal function
 - Most internal functions expect to be declared STRICT

```
CREATE FUNCTION square_root(double precision)
RETURNS double precision AS
'dsqrt',
LANGUAGE internal STRICT;
```

<http://www.postgresql.org/docs/9.4/static/xfunc-internal.html>

C Language Functions

- User-defined functions written in C
 - Compiled into dynamically loadable objects (also called shared libraries)
 - Loaded by the server on demand
 - contrib is good source of examples
 - Same as internal function coding conventions
 - Require PG_MODULE_MAGIC call
 - Short example later, but deserves separate tutorial

<http://www.postgresql.org/docs/9.4/static/xfunc-c.html>

Language Availability

- PostgreSQL includes the following server-side procedural languages:

<http://www.postgresql.org/docs/9.4/static/xplang.html>

- PL/pgSQL
- Perl
- Python
- Tcl

- Other languages available:

http://pgfoundry.org/softwaremap/trove_list.php?form_cat=311

- Java
- V8 (Javascript)
- Ruby
- R
- Shell
- others ...

Creating New Functions

```
CREATE [ OR REPLACE ] FUNCTION
    name ( [ [ argmode ] [ argname ] argtype [ { DEFAULT | = } default_expr ]
           [, ...] ] )
    [ RETURNS rettype
    | RETURNS TABLE ( column_name column_type [, ...] ) ]
{ LANGUAGE lang_name
| WINDOW
| IMMUTABLE | STABLE | VOLATILE | [ NOT ] LEAKPROOF
| CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT
| [ EXTERNAL ] SECURITY INVOKER | [ EXTERNAL ] SECURITY DEFINER
| COST execution_cost
| ROWS result_rows
| SET configuration_parameter { TO value | = value | FROM CURRENT }
| AS 'definition'
| AS 'obj_file', 'link_symbol'
} ...
[ WITH ( attribute [, ...] ) ]
```

Dollar Quoting

- Works for all character strings
- Particularly useful for function bodies
- Consists of a dollar sign (\$), "tag" of zero or more characters, another dollar sign
- Start and End tag must match
- Nest dollar-quoted string literals by choosing different tags at each nesting level

```
CREATE OR REPLACE FUNCTION dummy () RETURNS text AS
$$_
BEGIN
    RETURN $$Say 'hello'$$;
END;
$$_
LANGUAGE plpgsql;
```

Anonymous Functions

```
DO [ LANGUAGE lang_name ] code
```

- Keyword DO executes anonymous code block
- Transient
- Any procedural language with support, defaults to plpgsql
- No parameters, returns void
- Parsed and executed once
- LANGUAGE clause can be before or after code block

<http://www.postgresql.org/docs/9.4/static/sql-do.html>

Anonymous Functions

```
DO $$  
DECLARE r record;  
BEGIN  
    FOR r IN SELECT u.rolname  
        FROM pg_authid u  
        JOIN pg_auth_members m on m.member = u.oid  
        JOIN pg_authid g on g.oid = m.roleid  
        WHERE g.rolname = 'admin'  
    LOOP  
        EXECUTE $$ ALTER ROLE $$ || r.rolname ||  
            $$ SET work_mem = '512MB' $$;  
    END LOOP;  
END$$;
```

Anonymous Functions

```
SELECT u.rolname, s.setconfig as setting
FROM pg_db_role_setting s
JOIN pg_authid u on u.oid = s.setrole
JOIN pg_auth_members m on m.member = u.oid
JOIN pg_authid g on g.oid = m.roleid
WHERE g.rolname = 'admin';
    rolname |      setting
-----+-----
 rockstar | {work_mem=512MB}
(1 row)
```

Changing Existing Functions

- Once created, dependent objects may be created
- Must do `DROP FUNCTION ... CASCADE` to recreate
- Or use `OR REPLACE` to avoid dropping dependent objects
- Very useful for large dependency tree
- Can't be used in some circumstances (must drop/recreate instead). You cannot:
 - change function name or argument types
 - change return type
 - change types of any OUT parameters

```
CREATE OR REPLACE FUNCTION ...;
```

Function Arguments - argmode

```
( [ [ argmode ] [ argname ] argtype [ { DEFAULT | = } default_expr ]
[ , ...] ] )
```

- **argmode** (optional): IN, OUT, INOUT, or VARIADIC
 - IN is the default if argmode is omitted
 - OUT and INOUT cannot be used with RETURNS TABLE
 - VARIADIC can only be followed by OUT
 - Not required (but good style): IN, then INOUT, then OUT
 - Func name + IN/INOUT/VARIADIC arg sig identifies function

```
CREATE FUNCTION testfoo (IN int, INOUT int, OUT int)
RETURNS RECORD AS $$  
VALUES ($2, $1 * $2);
$$ language sql;
SELECT * FROM testfoo(14, 3);
column1 | column2
-----+-----
      3 |      42
(1 row)
```

Function Arguments - argname

```
( [ [ argmode ] [ argname ] argtype [ { DEFAULT | = } default_expr ]
[, ...] ] )
```

- **argname** (optional):
 - Most, but not all, languages will use in function body
 - Use named notation to improve readability and allow reordering
 - Defines the OUT column name in the result row type

```
CREATE FUNCTION testfoo (IN a int, INOUT mult int = 2, OUT a int)
RETURNS RECORD AS $$  
VALUES (mult, a * mult);  
$$ language sql;  
SELECT * FROM testfoo(mult := 3, a := 14);  
mult | a  
-----+----  
     3 | 42  
(1 row)
```

Function Arguments - argtype

```
( [ [ argmode ] [ argname ] argtype [ { DEFAULT | = } default_expr ]
[ , ... ] ] )
```

- **argtype** (required) (optionally schema-qualified):
 - base, array, composite, or domain types
 - can reference the type of a table column:
`table_name.column_name%TYPE`
 - Polymorphic "pseudotypes":
⇒ anyelement, anyarray, anynonarray, anyenum, anyrange

```
CREATE FUNCTION testfoo (INOUT a anyelement, INOUT mult anyelement)
RETURNS RECORD AS $$  
VALUES (a * mult, mult);  
$$ language sql;  
SELECT * FROM testfoo(mult := 3.14, a := 2.71828);  
a      | mult  
-----+-----  
8.5353992 | 3.14  
(1 row)
```

Function Arguments - default_expr

```
( [ [ argmode ] [ argname ] argtype [ { DEFAULT | = } default_expr ]
[ , ...] ] )
```

- default_expr (optional):

- Used if arg not provided
- An expression coercible to arg type
- All input (IN/INOUT/VARIADIC) can have default
- Following args must also have defaults

```
CREATE FUNCTION testfoo (IN a int, INOUT mult int = 2, OUT a int)
RETURNS RECORD AS $$

    VALUES (mult, a * mult);

$$ language sql;
SELECT * FROM testfoo(14);
mult | a
-----+-----
      2 | 28
(1 row)
```

Function Overloading

- Input argument (IN/INOUT/VARIADIC) signature used
- Avoid ambiguities:
 - Type (e.g. REAL vs. DOUBLE PRECISION)
 - Function name same as IN composite field name
 - VARIADIC vs same type scalar

```
CREATE OR REPLACE FUNCTION foo (text) RETURNS text AS $$  
    SELECT 'Hello ' || $1  
$$ LANGUAGE sql;  
CREATE OR REPLACE FUNCTION foo (int) RETURNS text AS $$  
    SELECT ($1 / 2)::text || ' was here'  
$$ LANGUAGE sql;  
  
SELECT foo('42'), foo(84);  
     foo      |      foo  
-----+-----  
Hello 42 | 42 was here  
(1 row)
```

Function Return Type

```
[ RETURNS rettype
 | RETURNS TABLE ( column_name column_type [, ...] ) ]
```

- **rettype** (required) (optionally schema-qualified):
 - base, array, composite, or domain types
 - can reference the type of a table column:
`table_name.column_name%TYPE`
 - Polymorphic "pseudotypes":
 ⇒ anyelement, anyarray, anynonarray, anyenum, anyrange
 - Special "pseudotypes":
 - language_handler: procedural language call handler
 - fdw_handler: foreign-data wrapper handler
 - record: returning an unspecified row type
 - trigger: trigger function
 - void: function returns no value

Function Return Type

```
[ RETURNS rettype
 | RETURNS TABLE ( column_name column_type [, ...] ) ]
```

- **rettype** (required) (optionally schema-qualified):
 - INOUT/OUT args: RETURNS clause may be omitted
⇒ Note: does not return a set
 - If RETURNS present, must agree with OUT
 - SETOF modifier - "set returning" or "table" function

Function Return Type - OUT + No RETURNS

```
CREATE FUNCTION testbar1 (OUT f1 int, OUT f2 text) AS $$  
    VALUES (42, 'hello'), (64, 'world');  
$$ language sql;  
SELECT * FROM testbar1();  
  
f1 | f2  
----+----  
42 | hello  
(1 row)
```

Function Return Type - OUT + SETOF RECORD

```
CREATE FUNCTION testbar2 (OUT f1 int, OUT f2 text)
RETURNS SETOF RECORD AS $$  
    VALUES (42, 'hello'), (64, 'world');
$$ language sql;
```

```
SELECT * FROM testbar2();
```

f1	f2
42	hello
64	world

(2 rows)

Function Return Type - Custom Type

```
CREATE TYPE testbar3_type AS (f1 int, f2 text);
CREATE FUNCTION testbar3 ()
RETURNS SETOF testbar3_type AS $$%
    VALUES (42, 'hello'), (64, 'world');
$$% language sql;
SELECT * FROM testbar3();
f1 | f2
----+-----
42 | hello
64 | world
(2 rows)
```

Function Return Type - RETURNS TABLE

```
CREATE FUNCTION testbar4 ()  
RETURNS TABLE (f1 int, f2 text) AS $$  
    VALUES (42, 'hello'), (64, 'world');  
$$ language sql;  
SELECT * FROM testbar4();  
  
f1 | f2  
----+-----  
42 | hello  
64 | world  
(2 rows)
```

Function Return Type - unspecified RECORD

```
CREATE FUNCTION testbar5 ()  
RETURNS SETOF RECORD AS $$  
    VALUES (42, 'hello'), (64, 'world');  
$$ language sql;  
SELECT * FROM testbar5() as t(f1 int, f2 text);  
  
f1 | f2  
----+-----  
42 | hello  
64 | world  
(2 rows)
```

Function Return Type - RETURNS scalar

```
CREATE FUNCTION testbar6 ()  
RETURNS SETOF int AS $$  
    VALUES (42), (64);  
$$ language sql;  
SELECT * FROM testbar6();  
testbar6  
-----  
     42  
     64  
(2 rows)
```

Function Return Type - RETURNS scalar with alias

```
CREATE FUNCTION testbar7 ()  
RETURNS SETOF int AS $$  
    VALUES (42), (64);  
$$ language sql;  
SELECT * FROM testbar7() AS t(f1);  
f1  
----  
42  
64  
(2 rows)
```

Function Return Type - Targetlist

```
SELECT testbar2();  
testbar2  
-----  
(42,hello)  
(64,world)  
(2 rows)
```

Function Return Type - Targetlist, expanded

```
SELECT (testbar2()).*;  
f1 | f2  
----+----  
42 | hello  
64 | world  
(2 rows)
```

LANGUAGE

```
LANGUAGE lang_name
```

- Language of function body
 - Native: Internal, SQL
 - Interpreted, core: PL/pgSQL, PL/Perl, PL/Python, PL/Tcl
 - Interpreted, external: PL/Java, PL/J, PL/V8, PL/Ruby, PL/R, PL/Sh
 - Compiled, external: Custom C loadable libraries
 - Some (e.g. perl, tcl) have "trusted" and "untrusted" variants

```
CREATE FUNCTION ...  
LANGUAGE sql;  
LANGUAGE plpgsql;  
LANGUAGE plperlu;  
LANGUAGE plr;  
LANGUAGE C;  
LANGUAGE internal;
```

WINDOW

WINDOW

- Window Functions

- Indicates function is a window function rather than "normal" function
- Provides ability to calculate across sets of rows related to current row
- Similar to aggregate functions, but does not cause rows to become grouped
- Able to access more than just the current row of the query result
- Window functions can be written in C, PL/R, PL/V8, others?

WINDOW

- Several window functions built-in

```
select distinct proname from pg_proc where proiswindow order by 1;
   proname
-----
cume_dist
dense_rank
first_value
lag
last_value
lead
nth_value
ntile
percent_rank
rank
row_number
(11 rows)
```

Volatility

- VOLATILE (default)
 - Each call can return a different result
Example: `random()` or `timeofday()`
 - Functions modifying table contents must be declared volatile
- STABLE
 - Returns same result for same arguments within single query
Example: `now()`
 - Consider configuration settings that affect output
- IMMUTABLE
 - Always returns the same result for the same arguments
Example: `lower('ABC')`
 - Unaffected by configuration settings
 - Not dependent on table contents

Volatility

```
select distinct proname, provolatile
from pg_proc
where proname in ('lower', 'now', 'timeofday') order by 1;
   proname | provolatile
-----+-----
lower    | i
now      | s
timeofday | v
(3 rows)
```

Volatility

```
select lower('ABC'), now(), timeofday() from generate_series(1,3);
lower |           now           |          timeofday
-----+-----+-----+
abc   | 2014-08-17 12:26:08.407439-07 | Sun Aug 17 12:26:08.408005 2014 PDT
abc   | 2014-08-17 12:26:08.407439-07 | Sun Aug 17 12:26:08.408042 2014 PDT
abc   | 2014-08-17 12:26:08.407439-07 | Sun Aug 17 12:26:08.408048 2014 PDT
(3 rows)

select lower('ABC'), now(), timeofday() from generate_series(1,3);
lower |           now           |          timeofday
-----+-----+-----+
abc   | 2014-08-17 12:26:13.215355-07 | Sun Aug 17 12:26:13.215566 2014 PDT
abc   | 2014-08-17 12:26:13.215355-07 | Sun Aug 17 12:26:13.215586 2014 PDT
abc   | 2014-08-17 12:26:13.215355-07 | Sun Aug 17 12:26:13.215591 2014 PDT
(3 rows)
```

Behavior with Null Input Values

- CALLED ON NULL INPUT (default)
 - Function called normally with the null input values
- RETURNS NULL ON NULL INPUT
 - Function not called when null input values are present
 - Instead, null is returned automatically

```
CREATE FUNCTION sum1 (int, int) RETURNS int AS $$  
    SELECT $1 + $2  
$$ LANGUAGE SQL RETURNS NULL ON NULL INPUT;  
CREATE FUNCTION sum2 (int, int) RETURNS int AS $$  
    SELECT COALESCE($1, 0) + COALESCE($2, 0)  
$$ LANGUAGE SQL CALLED ON NULL INPUT;  
  
SELECT sum1(9, NULL) IS NULL AS "true", sum2(9, NULL);  
true | sum2  
-----+-----  
 t   |   9  
(1 row)
```

Security Attributes - LEAKPROOF

- LEAKPROOF requirements

- No side effects
- Reveals no info about args other than by return value
- Planner may push leakproof functions into views created with the security_barrier option
- Can only be set by the superuser

Security Attributes - LEAKPROOF

```
\c - postgres
DROP TABLE IF EXISTS all_books CASCADE;
CREATE TABLE all_books(id serial primary key,
                      luser text,
                      bookname text,
                      price int);

INSERT INTO all_books
SELECT g.f,
       CASE WHEN g.f % 2 = 0 THEN 'joe' ELSE 'tom' END,
       'book-' || g.f::text,
       40 + g.f % 20
FROM generate_series(1,8) as g(f);

DROP VIEW IF EXISTS user_books;
CREATE VIEW user_books AS
SELECT id, luser, bookname, price FROM all_books
WHERE luser = CURRENT_USER;
GRANT ALL ON user_books TO public;
```

Security Attributes - LEAKPROOF

- Note the "COST 1" below . . .

```
CREATE OR REPLACE FUNCTION leak_info(text, text) returns int AS $$  
BEGIN  
    IF $1 != CURRENT_USER THEN  
        RAISE NOTICE '%:%', $1, $2;  
    END IF;  
    RETURN 0;  
END;  
$$ COST 1 LANGUAGE plpgsql;
```

Security Attributes - LEAKPROOF

```
\c - joe
EXPLAIN ANALYZE SELECT * FROM user_books
  WHERE leak_info(luser, bookname) = 0;
NOTICE: tom:book-1
NOTICE: tom:book-3
NOTICE: tom:book-5
NOTICE: tom:book-7
```

QUERY PLAN

```
Seq Scan on all_books  (cost=0.00..1.18 rows=1 width=72) (actual ...
  Filter: ((leak_info(luser, bookname) = 0) AND
            (luser = ("current_user"())::text))
  Rows Removed by Filter: 4
Planning time: 0.674 ms
Execution time: 2.044 ms
(5 rows)
```

Security Attributes - LEAKPROOF

- Note the "WITH (security_barrier)" below . . .

```
\c - postgres
DROP VIEW user_books;
CREATE VIEW user_books WITH (security_barrier) AS
  SELECT id, luser, bookname, price FROM all_books
  WHERE luser = CURRENT_USER;
GRANT ALL ON user_books TO public;
```

Security Attributes - LEAKPROOF

```
\c - joe
EXPLAIN ANALYZE SELECT * FROM user_books
WHERE leak_info(luser, bookname) = 0;
        QUERY PLAN
-----
Subquery Scan on user_books  (cost=0.00..1.16 rows=1 width=72) (actual ...
    Filter: (leak_info(user_books.luser, user_books.bookname) = 0)
    -> Seq Scan on all_books  (cost=0.00..1.14 rows=1 width=72) (actual ...
        Filter: (luser = ("current_user"())::text)
        Rows Removed by Filter: 4
Planning time: 0.648 ms
Execution time: 1.903 ms
(7 rows)
```

Security Attributes - LEAKPROOF

```
\c - postgres
ALTER FUNCTION leak_info(text, text) LEAKPROOF;
```

```
\c - joe
EXPLAIN ANALYZE SELECT * FROM user_books
WHERE leak_info(luser, bookname) = 0;
NOTICE: tom:book-1
NOTICE: tom:book-3
NOTICE: tom:book-5
NOTICE: tom:book-7
```

QUERY PLAN

```
Seq Scan on all_books  (cost=0.00..1.18 rows=1 width=72) (actual ...
  Filter: ((leak_info(luser, bookname) = 0) AND
            (luser = ("current_user"())::text))
  Rows Removed by Filter: 4
Planning time: 0.646 ms
Execution time: 2.145 ms
(5 rows)
```

Security Attributes - LEAKPROOF

- Lesson
 - Be sure function really is leak proof before making LEAKPROOF
- Why use LEAKPROOF at all?
 - Performance (predicate push down)

Security Attributes - SECURITY INVOKER/DEFINER

- SECURITY INVOKER (default)
 - Function executed with the rights of the current user
- SECURITY DEFINER
 - Executed with rights of creator, like "setuid"

```
\c - postgres
CREATE TABLE foo (f1 int);
INSERT INTO foo VALUES(42);
REVOKE ALL ON foo FROM public;
CREATE FUNCTION see_foo() RETURNS TABLE (luser name, f1 int) AS $$
  SELECT CURRENT_USER, * FROM foo
$$ LANGUAGE SQL SECURITY DEFINER;
\c - guest
SELECT * FROM foo;
ERROR: permission denied for relation foo
SELECT CURRENT_USER AS me, luser AS definer, f1 FROM see_foo();
   me    | definer  | f1
-----+-----+-----
 guest | postgres | 42
(1 row)
```

Optimizer Hints

```
COST execution_cost
ROWS result_rows
```

- execution_cost
 - Estimated execution cost for the function
 - Positive floating point number
 - Units are cpu_operator_cost
 - Cost is per returned row
 - Default: 1 unit for C-language/internal, 100 units for all others
- result_rows
 - Estimated number rows returned
 - Positive floating point number
 - Only allowed when declared to return set
 - Default: 1000

Optimizer Hints

```
CREATE FUNCTION testbar8 ()  
RETURNS SETOF int AS $$  
    VALUES (42), (64);  
$$ LANGUAGE sql COST 0.1 ROWS 2;  
  
SELECT procost, prorows FROM pg_proc WHERE proname = 'testbar8';  
procost | prorows  
-----+-----  
     0.1 |      2  
(1 row)
```

Function Local Configs

```
SET configuration_parameter
{ TO value | = value | FROM CURRENT }
```

- SET clause
 - Specified config set to value for duration of function
 - SET FROM CURRENT uses session's current value

```
CREATE FUNCTION testbar9 ()
RETURNS SETOF int AS $$  
VALUES (42), (64);
$$ LANGUAGE sql SET work_mem = '512MB';
```

```
SELECT proconfig FROM pg_proc WHERE proname = 'testbar9';
proconfig
-----
{work_mem=512MB}
(1 row)
```

Function Body

```
AS definition
| AS obj_file, link_symbol
```

- definition

- String literal
- Parse by language parser
- Can be internal function name
- Can be path to object file if C language function name matches
- Dollar quote, or escape single quotes and backslashes

Function Body

```
AS definition  
| AS obj_file, link_symbol
```

- obj_file, link_symbol
 - Used when C language function name does not match SQL function name
 - obj_file is path to object file
⇒ \$libdir: replaced by package lib dir name, determined at build time
 - link_symbol is name of function in C source code
 - When more than one FUNCTION call refers to same object file, file only loaded once

```
# pg_config --pkglibdir  
/usr/local/pgsql-REL9_4_STABLE/lib
```

Function Body

```
CREATE FUNCTION foobar ()  
RETURNS int AS $$  
    SELECT 42;  
$$ LANGUAGE sql;  
  
CREATE OR REPLACE FUNCTION plr_version ()  
RETURNS text  
AS '$libdir/plr','plr_version'  
LANGUAGE C;
```

Simple

```
CREATE FUNCTION sum (text, text)
RETURNS text AS $$  
    SELECT $1 || ' ' || $2
$$ LANGUAGE SQL;  
  
SELECT sum('hello', 'world');
sum
-----
hello world
(1 row)
```

Custom Operator

```
CREATE OPERATOR + (
    procedure = sum,
    leftarg = text,
    rightarg = text
);
SELECT 'hello' + 'world';
?column?
-----
hello world
(1 row)
```

Custom Aggregate

```
CREATE OR REPLACE FUNCTION concat_ws_comma(text, ANYELEMENT)
RETURNS text AS $$  
    SELECT concat_ws(',', $1, $2)
$$ LANGUAGE sql;  
  
CREATE AGGREGATE str_agg (ANYELEMENT) (
    sfunc = concat_ws_comma,
    stype = text);  
  
SELECT str_agg(f1) FROM foo;  
str_agg  
-----  
41,42  
(1 row)
```

SETOF with OUT Arguments

```
CREATE OR REPLACE FUNCTION sql_with_rows(OUT a int, OUT b text)
RETURNS SETOF RECORD AS $$  
    values (1,'a'),(2,'b')
$$ LANGUAGE SQL;  
  
select * from sql_with_rows();  
a | b  
---+---  
1 | a  
2 | b  
(2 rows)
```

INSERT RETURNING

```
CREATE TABLE foo (f0 serial, f1 int, f2 text);

CREATE OR REPLACE FUNCTION
sql_insert_returning(INOUT f1 int, INOUT f2 text, OUT id int) AS $$ 
  INSERT INTO foo(f1, f2) VALUES ($1,$2) RETURNING f1, f2, f0
$$ LANGUAGE SQL;

SELECT * FROM sql_insert_returning(1,'a');
 f1 | f2 | id
----+---+---
  1 | a  | 1
(1 row)
```

Composite Argument

```
CREATE TABLE emp (name      text,  
                  salary    numeric,  
                  age       integer,  
                  cubicle   point);  
  
CREATE FUNCTION double_salary(emp) RETURNS numeric AS $$  
    SELECT $1.salary * 2 AS salary;  
$$ LANGUAGE SQL;  
  
SELECT name, double_salary(emp.*) AS dream  
FROM emp WHERE emp.cubicle ~= point '(2,1)';  
  
SELECT name,  
       double_salary(ROW(name, salary*1.1, age, cubicle)) AS dream  
FROM emp;
```

Polymorphic

```
CREATE FUNCTION myappend(anyarray, anyelement) RETURNS anyarray AS
$$
    SELECT $1 || $2;
$$ LANGUAGE SQL;

SELECT myappend(ARRAY[42,6], 21), myappend(ARRAY['abc','def'], 'xyz');
myappend | myappend
-----+-----
{42,6,21} | {abc,def,xyz}
(1 row)
```

Target List versus FROM Clause

```
CREATE FUNCTION new_emp() RETURNS emp AS $$  
    SELECT ROW('None', 1000.0, 25, '(2,2)')::emp;  
$$ LANGUAGE SQL;  
SELECT new_emp();  
new_emp  
-----  
(None,1000.0,25,"(2,2)")  
  
SELECT * FROM new_emp();  
name | salary | age | cubicle  
-----+-----+-----+-----  
None | 1000.0 | 25 | (2,2)  
  
SELECT (new_emp()).name;  
name  
-----  
None
```

VARIADIC

```
CREATE FUNCTION mleast(VARIADIC numeric[]) RETURNS numeric AS $$  
    SELECT min($1[i]) FROM generate_subscripts($1, 1) g(i);  
$$ LANGUAGE SQL;  
  
SELECT mleast(10, -1, 5, 4.4);  
mleast  
-----  
      -1  
(1 row)  
  
SELECT mleast(42, 6, 42.42);  
mleast  
-----  
      6  
(1 row)
```

DEFAULT Arguments

```
CREATE FUNCTION foo(a int, b int DEFAULT 2, c int DEFAULT 3)
RETURNS int LANGUAGE SQL AS $$SELECT $1 + $2 + $3$$;
```

```
SELECT foo(10, 20, 30);
```

```
foo
```

```
-----
```

```
60
```

```
(1 row)
```

```
SELECT foo(10, 20);
```

```
foo
```

```
-----
```

```
33
```

```
(1 row)
```

PL/pgSQL

- PL/pgSQL is SQL plus procedural elements
 - variables
 - if/then/else
 - loops
 - cursors
 - error checking
- Loading the language handler into a database:

```
CREATE EXTENSION plpgsql;
ERROR: extension "plpgsql" already exists
```

<http://www.postgresql.org/docs/9.4/static/plpgsql.html>

Simple

```
CREATE OR REPLACE FUNCTION sum (text, text)
RETURNS text AS $$

BEGIN
    RETURN $1 || ' ' || $2;
END;
$$ LANGUAGE plpgsql;

SELECT sum('hello', 'world');

sum
-----
hello world
(1 row)
```

Parameter ALIAS

```
CREATE OR REPLACE FUNCTION sum (int, int)
RETURNS int AS $$

DECLARE
    i ALIAS FOR $1;
    j ALIAS FOR $2;
    sum int;

BEGIN
    sum := i + j;
    RETURN sum;
END;
$$ LANGUAGE plpgsql;

SELECT sum(41, 1);
sum
-----
42
(1 row)
```

Named Parameters

```
CREATE OR REPLACE FUNCTION sum (i int, j int)
RETURNS int AS $$

DECLARE
    sum int;
BEGIN
    sum := i + j;
    RETURN sum;
END;
$$ LANGUAGE plpgsql;

SELECT sum(41, 1);

sum
-----
 42
(1 row)
```

Control Structures: IF ...

```
CREATE OR REPLACE FUNCTION even (i int)
RETURNS boolean AS $$

DECLARE
    tmp int;
BEGIN
    tmp := i % 2;
    IF tmp = 0 THEN RETURN true;
    ELSE RETURN false;
    END IF;
END;
$$ LANGUAGE plpgsql;

SELECT even(3), even(42);
even | even
-----+-----
 f   | t
(1 row)
```

Control Structures: FOR ... LOOP

```
CREATE OR REPLACE FUNCTION factorial (i numeric)
RETURNS numeric AS $$

DECLARE
    tmp numeric; result numeric;
BEGIN
    result := 1;
    FOR tmp IN 1 .. i LOOP
        result := result * tmp;
    END LOOP;
    RETURN result;
END;
$$ LANGUAGE plpgsql;
SELECT factorial(42::numeric);
          factorial
```

```
14050061177528798985431426062445115699363840000000000
(1 row)
```

Control Structures: WHILE ... LOOP

```
CREATE OR REPLACE FUNCTION factorial (i numeric)
RETURNS numeric AS $$

DECLARE tmp numeric; result numeric;
BEGIN
    result := 1; tmp := 1;
    WHILE tmp <= i LOOP
        result := result * tmp;
        tmp := tmp + 1;
    END LOOP;
    RETURN result;
END;
$$ LANGUAGE plpgsql;
```

```
SELECT factorial(42::numeric);
          factorial
```

```
1405006117752879898543142606244511569936384000000000
(1 row)
```

Recursive

```
CREATE OR REPLACE FUNCTION factorial (i numeric)
RETURNS numeric AS $$

BEGIN
    IF i = 0 THEN
        RETURN 1;
    ELSIF i = 1 THEN
        RETURN 1;
    ELSE
        RETURN i * factorial(i - 1);
    END IF;
END;
$$ LANGUAGE plpgsql;
```

```
SELECT factorial(42::numeric);
          factorial
```

```
1405006117752879898543142606244511569936384000000000
(1 row)
```

Record types

```
CREATE OR REPLACE FUNCTION format ()  
RETURNS text AS $$  
DECLARE  
    tmp RECORD;  
BEGIN  
    SELECT INTO tmp 1 + 1 AS a, 2 + 2 AS b;  
    RETURN 'a = ' || tmp.a || ';' || tmp.b;  
END;  
$$ LANGUAGE plpgsql;  
  
select format();  
format  
-----  
a = 2; b = 4  
(1 row)
```

PERFORM

```
CREATE OR REPLACE FUNCTION func_w_side_fx() RETURNS void AS
$$ INSERT INTO foo VALUES (41),(42) $$ LANGUAGE sql;

CREATE OR REPLACE FUNCTION dummy ()
RETURNS text AS $$

BEGIN
    PERFORM func_w_side_fx();
    RETURN 'OK';
END;
$$ LANGUAGE plpgsql;

SELECT dummy();
SELECT * FROM foo;
f1
-----
41
42
(2 rows)
```

Dynamic SQL

```
CREATE OR REPLACE FUNCTION get_foo(i int)
RETURNS foo AS $$

DECLARE
    rec RECORD;
BEGIN
    EXECUTE 'SELECT * FROM foo WHERE f1 = ' || i INTO rec;
    RETURN rec;
END;
$$ LANGUAGE plpgsql;

SELECT * FROM get_foo(42);
f1
-----
42
(1 row)
```

Cursors

```
CREATE OR REPLACE FUNCTION totalbalance()
RETURNS numeric AS $$

DECLARE
    tmp RECORD; result numeric;
BEGIN
    result := 0.00;
    FOR tmp IN SELECT * FROM foo LOOP
        result := result + tmp.f1;
    END LOOP;
    RETURN result;
END;
$$ LANGUAGE plpgsql;

SELECT totalbalance();
totalbalance
-----
          83.00
(1 row)
```

Error Handling

```
CREATE OR REPLACE FUNCTION safe_add(a integer, b integer)
RETURNS integer AS $$

BEGIN
    RETURN a + b;
EXCEPTION
    WHEN numeric_value_out_of_range THEN
        -- do some important stuff
        RETURN -1;
    WHEN OTHERS THEN
        -- do some other important stuff
        RETURN -1;
END;
$$ LANGUAGE plpgsql;
```

<http://www.postgresql.org/docs/9.4/static/errcodes-appendix.html>

Nested Exception Blocks

```
CREATE FUNCTION merge_db(key integer, data text)
RETURNS void AS $$

BEGIN
    LOOP
        UPDATE db SET b = data WHERE a = key;
        IF found THEN RETURN;
    END IF;
    BEGIN
        INSERT INTO db (a, b) VALUES (key, data);
        RETURN;
    EXCEPTION WHEN uniqueViolation THEN
        -- do nothing
    END;
    END LOOP;
EXCEPTION WHEN OTHERS THEN
    -- do something else
END;
$$ LANGUAGE plpgsql;
```

Window Function

```
CREATE TABLE mydata (
    pk int primary key,
    mydate date NOT NULL,
    gender text NOT NULL CHECK(gender IN ('M','F')),
    mygroup text NOT NULL,
    id int NOT NULL
);

INSERT INTO mydata VALUES
(1, '2012-03-25', 'F', 'A', 1), (2, '2005-05-23', 'F', 'B', 2),
